Abstract :

Workshop to present the therapeutic means implemented in young patients, from the temporary dentition, allowing an early correction of frequently observed dento-skeletal dysmorphoses:

- Treatment of transverse dimension anomalies by maxillary expansion (quad'helix, expanders, palatal plates...)
- Treatment of vertical dimension anomalies (removable plates...)
- Treatment of sagittal dimension anomalies (chin slings, DELAIRE mask, multi-attachment on temporary teeth...)

According to the different clinical situations, the construction methods as well as the placement of the appliances will be presented on pedagogical models.
