Abstract :

Result of the collaboration of some fifty specialists, *La bouche de l'enfant et de l'adolescent* is interested in issues related to the oral cavity with precision, pedagogy and a lot of illustrations in order to provide the essential elements to detect and diagnose pathologies of the oral sphere affecting children and adolescents. This book offers clear answers to more or less common specific clinical situations, and provides orientation criteria and suggested courses of action.

Emphasis is put on the development of the oral cavity and the major associated functions, on dysmorphism (clefts, abnormalities of the tongue, etc.), pathologies of the oral and perioral mucosa, tumors of the oral cavity and the consequences of treatments in pediatric oncology. Dental anomalies, carious disease, functional disorders and the management of trauma to the lower stage of the face and teeth are

also discussed. The last chapter concerns specifically the multidisciplinary management of eating disorders, addiction-related disorders, children and adolescents with disabilities and the oral warning signs of rare diseases.
