Résumé :

Oral pathologies are a major health problem according to the WHO and can be closely linked to many general pathologies. It is important to be able to make an early diagnosis in order to orientate the treatment, reassure and advise the patients and/or their parents.

There are different types of dental pathologies in children, affecting temporary or permanent teeth or both. The most common of all is the carious lesion. But there are also structural anomalies of the enamel and/or dentin, anomalies of shape, of number... The purpose of this interactive communication is to make you aware of the different dental pathologies, to be able to identify them and advise your patients and thus improve their quality of life.
